RADIATION SHIELDING INFORMATION CENTER

**OAK RIDGE NATIONAL LABORATORY**

OPERATED BY UNION CARBIDE CORPORATION • FOR THE U.S. ATOMIC ENERGY COMMISSION

POST OFFICE BOX X •  
OAK RIDGE, TENNESSEE 37831

No. 27

February 15, 1967

## CURRENT WORK AND PROBLEMS

The Japan Atomic Energy Research Institute has summarized recent work in shielding in Japan in the report "Progress Report of Shielding Investigations in Japan," M. Shindo (Editor), (JAERI-4038).

A special purpose Monte Carlo program called BREV1 calculates gamma ray penetration of double layer slab geometries for point or plane sources, isotropic, monodirectional, or cosine distributed.

EOS-1 is a Legendre polynomial expansion solution of the Boltzmann equation for gamma rays in a slab geometry. It is said to resemble NIOBE in some features.

SELENE is a program which solves the gamma ray problem using the  $S_n$  method. It is particularly recommended in cases where there are sharp peaks in the fluxes. (That is, it is believed this program will perform better than EOS-1 in such cases.) Examples would be monoenergetic or monodirectional source cases.

All three of the above programs were written for the NEAC-2206 computer.

Exploratory studies of invariant imbedding applied to gamma ray transport are being made. Also investigations are being made of empirical forms suitable for representing multilayer gamma ray buildup factors and of leakage from simple geometric shapes (after Rockwell).

Experimental studies of buildup factors have been made in multilayer iron, water, lead shields using a  $^{60}\text{Co}$  source. Gamma ray energy spectra penetrating iron-polyethylene shields from a  $^{60}\text{Co}$  source were measured also. Gamma ray energy albedos for polyethylene and for aluminum have been measured with the use of  $^{137}\text{Cs}$  and  $^{60}\text{Co}$  sources. The backscattered flux density was found to consist principally of singly scattered radiation.

A system of programs called RAC has been devised to do neutron removal-diffusion problems. RAC is programmed for a 7044 computer.

EOS-2 is a Legendre polynomial expansion for neutrons as EOS-1 is for gamma rays.

A computation has been made to determine the photoneutron flux density at deep penetrations of a water shield around a reactor.

Experimental studies of neutron penetrations of iron-water laminations have been made using as a source a fission plate driven by a TRIGA reactor in a lid tank arrangement. Other neutron measurements in iron-water shields have been made with the Hitachi Training Reactor.

Removal cross sections were measured in a slab shield of iron, aluminum, and concrete using as a source 2.5 MeV (D-D) and 14 MeV (D-T) neutrons from an accelerator. No energy dependence of the removal cross section was noted.

Shield optimization studies for the ship reactor shield are being made at the JRR. Mockup shield tests are also being made with special attention to the streaming problem.

An experimental program has been carried on to study streaming through ducts in polyethylene, vinyl-chloride, iron, and lead. These measurements were carried on at the TRIGA lid tank facility at St. Paul's University. Various calculational methods for analyzing ducts are also under study.

#### REACTOR-WEAPONS SHIELDING ABSTRACTS UPDATED

Inserts for ORNL-RSIC-6, Abstracts of the Literature Examined by the Radiation Shielding Information Center, Vol. I, have recently been mailed to persons on the reactor-weapons shielding distribution. These inserts provide revisions and additions to the abstracts previously issued. A total of 1135 abstracts have now been issued for Vol. I.

#### RECENT VISITORS TO RSIC

The following people visited RSIC during the month of January 1967: N. R. Byrn, Brown Engineering Company, Huntsville, Alabama; Joseph J. Droher, Liquid Metals Information Center, Atomics International, Canoga Park, California; K. O. Johnson, Jr., Water Desalination Information Center, ORNL; W. E. Dreeszeu, Ames Laboratory, Ames, Iowa; Hans I. Holm, AB Atomenergi, Studsvik, Sweden; Wm. A. Hirsch and Wm. Atwell, General Electric, Daytona Beach, Florida.

#### JANUARY ACCESSION LIST OF LITERATURE

The RSIC is now aware of the literature cited in the following list. This literature has either been obtained by RSIC or has been placed on order. When received, this material will be examined and assigned to various files if suitable for our information system. The accession list is divided into three fields of (1) reactor and weapons shielding, (2) space and accelerator shielding, and (3) shielding computer codes. These titles are announced before processing and indexing so that there will be no delay and can serve as a prompt announcement of current literature.

RSIC is not a documentation center. Copies of the literature cited must generally be obtained from the author or from a documentation center such as the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia 22151.

RSIC maintains a microfiche file of literature entered into its information system. Computer searches of this system (which produces a special bibliography) and duplicate microfiche copies of literature in our file are available upon request. Naturally we cannot supply copies of literature which is copyrighted (such as books or journal articles) or whose distribution is restricted. Neither service is yet available for the codes literature.
